

DESIGN THE SYSTEM BEFORE BUILDING IT

From journeys to capabilities

Sketch works as a product map: it makes breadth, states, and relationships visible before they move into code.

11 PAGES287 FRAMES312 SYMBOLS

01 Coverage of a complete experience

The visual audit confirms that the document is not a collection of disconnected mockups. It covers journeys, variants, and components for a mobile-first product.

 Identity Access, registration, recovery, verification, and activation.	 Discovery Home, categories, carousels, filters, and search states.	 Local detail Place, menu, dish, event, and promotion through connected journeys.
 Participation Reviews, reactions, activity, and responses.	 Saves and sharing Collections, views, cards, and conceptual QR flows.	 Reusable system Symbols, typography, controls, lists, and visual variants.

02 From design file to backlog

The breadth becomes domains and dependencies, avoiding isolated screen implementation without a shared foundation.

 Journey Identify the decision the person is trying to complete.	 Pattern Extract states and elements that repeat.	 Capability Group UI, data, and rules within a domain.	 Contract Define shared boundaries before connecting applications.	 Delivery Implement one verifiable slice without losing the vision.
---	--	---	---	--

03 System decisions

The design-to-product strategy protects consistency, reduces duplication, and lets the rebuild advance in layers.

 Tokens and components	Color, typography, fields, buttons, and states form a shared grammar.	DESIGN SYSTEM
 Identity first	Access flows validate contracts, forms, and communication.	AUTH MFE
 Decoupled domains	Application, functions, email, and packages evolve with clear responsibilities.	MONOREPO
 Localization	Messages and contracts account for ES/EN in the technical foundation.	NEXT-INTL

04 Verifiable status

The public document does not present 287 frames as 287 completed screens. Every capability is labeled according to its real state.

Identity and recovery	IMPLEMENTED	Login, registration, recovery, code, new password, and activation.
Discovery system	DESIGNED	Home, search, filters, and detail documented in Sketch.
Profiles and activity	DESIGNED	Saves, reviews, reactions, and sharing are part of the vision.
Mobile application	NEXT STAGE	The mobile-first architecture is defined; a native app is not presented as delivered.

Design is not decoration here. It explains the product the code must sustain.
